

This steam generator can be employed wherever battery-powered boad, car and other models (including battery-operated trains, etc.) should smoke or steam realistically. Its compact size, 10 mm dia. x 39 mm long, permits installation in small models also. The high quality plastic sheathing keeps the steam generator's heat radiation to a minimum. The steam generator can be connected in parallel to the model's drive motor, regardless of polarity. However, to save the power source it is best to install the generator so that it can be switched on and off sparately. Power consumption with maximum steaming is approx. 0,3 A.

To put the steam generator into operation, the filling needle must be mounted on the filling tool, then take out max. 0,8 ml steam distillate from the bottle and fill it into the steam generator. Attention: Take care for the steam pipe with heating resistant in the middle of the steam generator, it is very sensitive and not replaceable.

Prerequisite for a safe operation is the use of original SEUTHE steam distillate.

It is available in following packs:

Art. No. 101 **Filling Set** Steam-Smoke-Destillate and filling tool for clean and accurate filling of the Steam- and Smoke-Generators

Art. No. 105 Steam-Smoke-Distillate, 50 ml-bottle

Art.-No. 106 Steam-Smoke-Distillate, 250 ml bottle

Made in Germany
